## ADVANC3<sup>™</sup>

### Frequently Asked Questions

- 1. What is the difference between ADVANC3<sup>™</sup> and Wilsonart SSV?**
  - a. The key difference is our current understanding of appropriate limitations. Performance properties of SSV were overestimated believing it to be suitable for applications where it ultimately failed. However 3mm solid surface continued in Europe successfully. Those markets remained focused on shop fitting applications where heat and moisture exposure were not a concern. ADVANC3<sup>™</sup> is a great upgrade from HPL and can offer some cost savings over 12mm in some applications.
  
- 2. How long is the warranty and what does it cover?**
  - a. ADVANC3<sup>™</sup> carries a full X year material only warranty. Warping or surface cracking believed to be caused by substrate lamination will not be covered.
  
- 3. Can ADVANC3<sup>™</sup> be used with under mount bowls?**
  - a. No. Supporting the weight of under mount bowls is much easier with 6mm or 12mm.
  
- 4. Does 3mm match 6mm and 12mm of the same color?**
  - a. Although every effort is made to keep the colors consistent between calipers, they are always made from different batch runs and color differences may show up when seaming.
  
- 5. Can I use ADVANC3<sup>™</sup> over existing tiles and other surfaces?**
  - a. No. ADVANC3<sup>™</sup> requires a solid and smooth surface for bonding.
  
- 6. Can I use ADVANC3<sup>™</sup> for wall cladding?**
  - a. Due to the 3mm caliper, uneven surfaces in the wall face will show through. 6mm is the preferred wall cladding product.
